TITLE: Spectral characteristics of GaAs p-n junctions in the near-ultraviolet 27-1

SOURCE: Fizika tverdogo tela, v. 8, no. 3, 1966, 712-716

TOPIC TAGS: gallium arsenide, p n junction, spectral energy distribution

ABSTRACT: The photosensitivity of GaAs p-n junctions was measured up to photon energies of 5.4 ev and at temperatures of 90, 293, and 370K. The investigations were made with the use of a quartz double monochromator during illumination of both the n- and p-surfaces of the samples. At photon energies higher than 3 ev, the photosensitivity increased slightly and then leveled off, only to increase again slightly at about 5 ev. The shapes of the characteristics remained similar during the illumination of the n- and p-surfaces. It is considered probable that the structure of the spectral characteristics of GaAs in the

Card 1/2

TITLE: Photosensitivity spectra of p-n junctions in InAs in the photon energy range  
0.9 - 5 ev

77-21

SOURCE: Fizika tverdogo tela, v. 8, no. 7, 1966, 2044-2047

TOPIC TAGS: pn junction, photosensitivity, internal photoeffect, indium compound optic material, arsenide, spectral distribution, absorption coefficient, quantum yield

ABSTRACT: This is a continuation of earlier work (FTT v. 8, 712, 1966), where it was observed that the spectral distribution of the quantum yield of the internal photoeffect in the short-range region is connected with singularities of the band structure of GaAs. The present work extends the investigation to InAs. The InAs p-n junctions were obtained by diffusion of Cd in n-type material with electron density (0.5 - 1)  $\times 10^{17} \text{ cm}^{-3}$  and were produced at a depth of several microns. The hole concentration in the illuminated surface of the sample was approximately  $10^{18} \text{ cm}^{-3}$ . Several p-n junctions illuminated from the n-side were also tested. The long-wave part of the spectral characteristic of the junction was plotted with the aid of a ZMR-2 monochromator, and the measurements at higher energies were by the procedure described in the earlier paper. The measurements showed a narrow long-wave photosensitivity peak,

Card 1/2

04791-67  
ACC NR: AP6024462

connected with the change of the absorption coefficient near the edge of the ground-state band, followed by a region of weak variation, a faster growth at ~0.7 - 1 ev photon energy, a reversal followed by minimum near 3.2 ev, and a renewed growth at higher energies. The results are shown to be connected with the variation of the quantum yield of the internal photoeffect as a result of secondary ionization. The threshold energy of the photon, starting with which the quantum yield begins to grow, is found to be 0.7 - 0.8 ev at 293K and 0.9 - 1 ev at 100K, in agreement with theoretical calculations by others. The various sections of the spectrum are interpreted on this basis, and it is indicated in the conclusion that the actual quantum yield may not be as large as what follows from theoretical considerations, since account must be taken of the probability ratios of the different electronic transitions. The authors thank N. P. Yesina and N. N. Smirnova for preparing the InAs p-n junctions.

TITLE: Spectral characteristics of GaP--GaAs photocells in the photon energy region  
 up to 5.4 ev

27.7 27

SOURCE: Fizika tverdogo tela, v. 8, no. 10, 1966, 3097-3099

TOPIC TAGS: gallium arsenide, gallium phosphide, gallium optic material, pn  
 junction, photoelectric cell, photosensitivity

ABSTRACT: This is a continuation of earlier work (Kosmicheskiye issledovaniya, IV,  
 128, 1966 and preceding papers) where the possibilities of GaP--GaAs p-n junctions  
 were first revealed and studied. The present paper describes investigations of the  
 photosensitivity of junctions prepared by diffusion of zinc in a GaAs plate in which  
 a region of variable composition  $\text{Ga}_x\text{As}_{(1-x)}$  was produced beforehand by heating in  
 phosphorus vapor. The preparation procedure and some properties of such a junction  
 were described earlier. The illuminated surface was subjected to various degrees of

Card 1/2

L 08129-67

ACC NR: AP6033579

etching. The tests consisted of plotting the photocurrent spectra and the spectrum  
 of the diffuse reflection. The results confirm the presence of a GaP layer at the junction  
 structure, and the presence of a peak near 3.6 ev, reveal that the surface layer  
 of the photocell contains not less than 90% of GaP and consequently its photo-  
 sensitivity spectrum is governed by the band structure of GaP. Comparison of the re-  
 flection and photosensitivity spectra shows that the photocurrent per incident absorbed  
 photon is constant (at  $\hbar\nu \approx 2.5$ --4.6 ev) and then drops off slightly towards 5.4 ev.  
 This is also confirms the GaP-type band structure, which precludes any possible in-  
 crease of the quantum yield for photons with energy lower than  $\sim 5.2$  ev, when the in-  
 ternal photoeffect and impact ionization come into play. The fact that the quantum  
 yield remains constant over a wide range of photon energies extending over different  
 parts of the Brillouin zone shows that the minority nonequilibrium carriers (electrons)  
 excited by the photons in different parts of the conduction band have time to go over  
 to the equilibrium state at room temperature within a time shorter than the carrier  
 lifetime ( $< 10^{-9}$  sec). Consequently the drop in photosensitivity in the 2.6--3.5 ev  
 region, which decreases strongly when the cell surface is etched, may be due to an in-  
 creased role of surface recombination with increasing absorption coefficient, and not  
 to a decrease in lifetime. The authors thank A. S. Toporets, A. V. Sheklein, and N. B.  
 Rekant for measuring the diffuse-reflection spectra. Orig. art. has: 1 figure.

AUTHORS: Mamedaliyev, Yu. G., Babakhanov, R. A., Magerramov, M. N.

TITLE: Haloalkylation of toluene by means of haloalkenes in the presence of sulfuric acid

PERIODICAL: Referativnyy zhurnal. Khimiya, no. 23, 1962, 246, abstract 23Zh103 (Azerb. khim. zh., no. 6, 1961, 37-42 [summary in Azerb.])

TEXT: Continuing their work (RZhKhim, 1961, 24N378) the authors studied haloalkylation of toluene (I) by vinyl chloride (II), by allyl bromide (III), by allyl chloride (IV) and by metallyl chloride (V) in the presence of  $H_2SO_4$ . It was found that III-V reacting with I give the corresponding aromatic alkyl compounds with a halogen atom in the side chain, and that II does not react with I under the conditions in question. It was found by IR spectroscopy that addition of haloalkenes to I takes place at the double bond in accordance with Markownikoff's rule. It was shown that the product consists basically of a para-isomer with an admixture of a meta-isomer. The effects of temperature, ratio of components, quantity and concentration

Card 1/4

Haloalkylation of toluene by means ...

S/081/62/000/023/032/120  
B168/B186

of  $H_2SO_4$  and duration of reaction on the formation of reaction products were studied. It was found that if the reaction temperature is raised to a specific limit the yield of monoalkylhalogen derivative of I increases and reaches its maximum. If the temperature is raised beyond the optimum the reaction is complicated by side reactions of the ensuing substitution and by increased sulfonation of I. It was found that a rise in the quantity of I in the reaction mixture increases the yield of monoalkylhalogen derivative from I and reduces the content of products of the ensuing substitution. A rise in the quantity of  $H_2SO_4$  increases the yield of monoalkylhalogen derivative from I but reduces the total yield of the organic layer owing to intensification of the sulfonation reaction of the initial I. If the reaction time is increased from 0.5 to 2 hrs the yield of 1-bromine-2-tolylpropane (VI) varies within the range 21.8-24.5%. Under optimum reaction conditions (these were found to be: temperature  $40^{\circ}C$ , reaction time 1 hr, mixing time 1 hr, 94%  $H_2SO_4$ , ratio I:II-V: $H_2SO_4$  = 1:0.25:0.5), the yields of 1-chloro-2-tolylpropane (VII),  $\beta$ -chloro-tert-butyltoluene (VIII) and VI were 5.3, 69.9 and 41.8% (of the theoretical

Card 2/4

S/081/62/000/023/032/120

B168/B186

Haloalkylation of toluene by means ...

quantity) respectively. The relatively low yield of VII compared with that of VI is due to the high electronegativity of Cl and therefore also to the induction effect and the conjugation effect, which reduce the reactivity of the double bond. The deactivating effect of the Cl atom in V on the double bond is still more discernible in the case of II. The effect of the Cl atom in V on the double bond is partly offset by the effect of the  $\text{CH}_3$  group, which activates the double bond. I (b.pt.

$110.6-110.8^\circ\text{C}$ ,  $n^{20}\text{D}$  1.4968,  $d_4^{20}$  0.8658) was made to react with II-V, as described earlier (see reference above).  $\text{H}_2\text{SO}_4$  of varying concentration was used as catalyst. II, IV (b. pt.  $44-45^\circ\text{C}$ ,  $n^{20}\text{D}$  1.4150,  $d_4^{20}$  0.9375) and V(b. pt.  $70-71^\circ\text{C}$ ,  $n^{20}\text{D}$  1.4290,  $d_4^{20}$  0.9267) were obtained by the method described earlier (see Yu. G. Mamedaliyev, M. M. Guseynov, Paper read at the II Mezhdunar. kongr. po katalizu (2nd International Congress on Catalysis), paper no. 122, section 3, 1960). III, b. pt.  $70-71^\circ\text{C}$ ,  $n^{20}\text{D}$  1.4648,  $d_4^{20}$  1.3976, was obtained from  $\text{CH}_2=\text{CHCH}_2\text{OH}$ . For the

**ALKYLATION OF AROMATIC HYDROCARBONS BY ALLYL BROMIDE IN  
THE PRESENCE OF SULFURIC ACID**

*Akademiya nauk Azerbaydzhanskoy SSR Doklady* 18(2) 1962, 25-30

*Text.* A previous report showed that allyl bromide in the presence of sulfuric acid easily reacts with benzene yielding the corresponding substitution product. In the present communication, comparative studies were made on the alkylation of benzene, toluene, ethyl benzene and cumene by allyl bromide in the presence of sulfuric acid. The importance of aromatic hydrocarbons containing in their side chain halogen atoms in  $\beta$ -position is stressed for the preparation of thermostable plastic materials etc. The mechanism of interaction between aromatic hydrocarbons and alkene halides is discussed. The dependence of product composition on the catalyst used is described. The use of sulfuric acid as a catalyst permits the reaction along the double bond with the preservation of the halogen atom in the final product. The results of several typical experiments carried out in the presence of 94%  $H_2SO_4$  and a molar ratio of aromatic hydrocarbons to allyl bromide of 4:1 are presented. The duration of the reaction: 2 hours,  $t$  (optimal) 50°C. A number of alkyl aromatic compounds

TITLE: Allylation of naphthalene,  $\alpha$ -methylnaphthalene, tetralin, acenaphthene,  
biphenyl and fluorene by allyl alcohol in the presence of acid catalysts

SOURCE: AN AzerbSSR. Doklady, v. 22, no. 9, 1966, 39-42

TOPIC TAGS: allyl alcohol, naphthalene, diphenyl compound, fluorene, acenaphthene

ABSTRACT: Allyl derivatives of polynuclear and condensed aromatic hydrocarbons were synthesized by allylation of the latter with allyl alcohol in the presence of the acid catalysts  $ZnCl_2$ ,  $FeCl_3$  and  $SnCl_4 \cdot 6H_2O$ .  $ZnCl_2$  was found to be the most effective catalyst. The following compounds were obtained (yields are given in parentheses): allylnaphthalene (68.3%), allyl- $\alpha$ -methylnaphthalene (88.1%), allyltetralin (55.8%), allylbiphenyl (44.5%), allylacenaphthene (34.8%), and allylfluorene (50.0%). The effect of different reaction parameters such as temperature, ratio of the reacting components, amount of catalyst, duration of experiment, etc. on the yield of the products was studied. Monoallyl derivatives were found to form almost exclusively. If  $FeCl_3$  or  $SnCl_4 \cdot 6H_2O$  are used, the allylation reaction is slow and the yield of allyl derivatives does not exceed 15-20%. The paper was presented by Academician

TITLE: Thickening of low viscosity lubricating oils by the addition of polypropylene with low molecular weight

SOURCE: Azerbaydzhanskiy khimicheskiy zhurnal, no. 4, 1965, 3-5

TOPIC TAGS: lubricant, lubricant property, fuel and lubricant additive, lubricant viscosity, polyisobutylene, polypropylene plastic, synthetic material, lubricant additive, viscosity additive

ABSTRACT: The possibility of replacing polyisobutylene by low molecular weight polypropylene as a thickening additive for lubricating oils is examined. The polyisobutylene and polypropylene used in this study had a molecular weight of 20,000. The polypropylene was a by-product of propylene polymerization and was extracted with normal pentane at low and high temperatures. Thickening effectiveness was examined by mixing 3% polymer additive with MK-8 commercial grade lubricating oil and 5% polymer additive with "L" commercial turbine oil. The results (viscosity, viscosity index, induction period, etc.) indicate that the by-product polypropylene is equivalent to polyisobutylene as a thickening additive for commercial lubricating oils. TITLE: Organophosphorus stabilizers for polypropylene

SOURCE: Plasticheskiye massy, no. 8, 1966, 12-15

TOPIC TAGS: organic phosphorus compound, polypropylene plastic, chemical stabilizer

ABSTRACT: Thirteen different organophosphorus compounds were synthesized and tested as stabilizers of thermal and light aging of polypropylene. All were found to be better as thermostabilizers, except one, which was also effective against light aging. Analysis of the data from the standpoint of the structure of the compounds tested indicates that organophosphorus stabilizers for polypropylene should be prepared from alkyl phenols rather than esters of salicylic acid. Because of natural aging in air after the action of the stabilizer has ceased, the mechanical strength of polypropylene decreases; in this connection, the effect of the same stabilizers on secondary polypropylene was studied, and a slight diminution of the effectiveness of the stabilizer was observed. It is shown that by suitably selecting the stabilizer and its concentration, one can effectively improve the aging properties of secondary polypropylene. The organophosphorus compounds act not only as stabilizers, but in some cases also promote

ABSTRACT: An analysis is made of wind observations at six meteorological stations: Ogurchinskiy Island, Krasnovodsk, Kara-Bogaz-Gol, Sumgait, Mashtagi, Baku. The observations used were for January and July from 1953 to 1957. A comparison of data obtained on the Apsheron Peninsula and the Transcaspian shows that the Main Caucasus Range in January and July accelerates winds from the north-northwestern sector on an average of 2.1—3 m/sec. Furthermore, the total amount of air flowing through the Apsheron Peninsula as a result of inter-latitudinal exchange is 2.5—4 times greater than that in the open Transcaspian

TEXT: The results of measurements of artificial radioactivity of the atmosphere in Iasi from 1958 - 1960 are given. Atmospheric samples of deposits were collected every 24 hours. It was observed that in 1960 there were a few cases of increased radioactivity caused by the nuclear explosions in the Sahara (in excess of 1 000  $\mu$ curie/km<sup>2</sup>) and during the spring and summer a general increase of the long-life fission products was also observed. Towards the end of 1960 the artificial radioactivity of the atmosphere decreased to 20 - 30  $\mu$ curie/km<sup>2</sup>. The dose of

Title : Nonlinear Semiconductor Elements

Orig Pub : Prace Przemys.. Inst. telekomun., 1954, 4, No 11, 7-22

Abstract : A detailed survey of contemporary status of the technique of semi-conductor diodes. The mechanism of the action of the diode, the electric characteristics, and the spectral problems are considered. The author touches also on certain problems in the technology of silicon and germanium. Bibliography, 11 titles.
